

Review the Data Model in this File

[aboutmeerdigram.pdf](#)

We'll learn Data Modeling next week.

Create an *aboutme* database like you have created others

Run the scripts to create the tables.

Create an *interaction* table per the model.

Make sure you include foreign key constraints.

Then, write insert (and/or update) statements for all tables.

You can start with one or two rows for each table

If you do not want to reveal 'private' information make up what you like.

Please understand what each column means.

You do not need a lot of 'Life Event' and 'Interactions'.

Try to drop the *event\_type* table.

What happens?

Why?

Be prepared to present your 'about me' to the class.
