In our class exercise we created a 'GUEST' role.

For our wedding we are hiring and husband and wife wedding planner team or Rosie and Rich. For you assignment, using a wedding planning role, they should only have access to the guest table, but only for guests that are coming to the wedding. Also, do not let them see the following fields:

Staying at Hotel Ind , Received Gift Ind" and Gift Description.

Accomplish the above specific limitation in 2 ways:

1. With a single View
2. Using Column Level and Row Level Security (we did Column Level Security on the class, but not row)
3. Create a SQL script that accomplishes the above and shows all results:

Both Rosie and Rich need to login to the database.

Please show all SQL and results including any errors or messages showing access or lack of access.
